

CREATE YOUR OWN WEBSITE - WORDS TO KNOW

- Web address:** The unique location of a Web page, often the home page for a Website. It may contain both alpha and numeric characters. To view or locate a specific website you should type the address in the “address bar” on Internet Explorer and then press *enter*.
Example: The address for Yahoo is: <http://www.yahoo.com>
- Web host:** An entity that provides the hardware and software necessary to store websites and deliver them to The Internet. There are literally thousands of these web hosting services, ranging from individuals to multinational corporations. Yahoo offers subscribers free space for a small Website on Geocities. **America Online** gives its subscribers a small amount of free Website space on **Hometown**. See “Create Your Own Web Page” at <http://hometown.aol.com>
- Web page:** A document or file that is formatted for graphical viewing and which has a unique Internet address.
- Website:** A document or group of related documents that appear on the World Wide Web. The document or file that you start with is called a home page.
- World Wide Web:** Often (erroneously) used interchangeably with The Internet, it is actually a graphical way of accessing The Internet using http protocol (one of many possible data/communication languages). It is often referred to as The Web for short.
